STUDEX

Proposal for Strategic Engagement

with the Government of Rwanda

Studex Rwanda AI, Innovation, Trade & Infrastructure Mission

Kigali, Rwanda | Delegation Mission

Build in Rwanda. Train in Rwanda. Export from Rwanda. Scale from Rwanda into Africa and the world.

Proposed by Studex / Aesthetics Global Markets Technology

Studex Rwanda AI, Innovation, Trade & Infrastructure Mission

Kigali, Rwanda | 17-22 August 2026

Proposed by: Studex / Aesthetics Global Markets Technology

1. Purpose of the Visit

Studex respectfully requests meetings with relevant representatives of the Government of Rwanda and associated national institutions during our delegation visit to Rwanda from 17-22 August 2026.

The purpose of the mission is to explore a long-term Rwanda-Studex collaboration across: Artificial intelligence; African AI infrastructure and data centres; Startup development; Gaming and digital talent; Women entrepreneurship; Coffee and agricultural exports; Conservation technology; Livestock and agricultural technology; Digital skills; International market access; Investment and fundraising; Pan-African technology partnerships.

Our intention is not simply to hold a series of events. We would like to explore making Rwanda a strategic East African operating and innovation hub within the Studex ecosystem.

Rwanda already has a national ambition to become a global centre for responsible AI research and innovation, while Kigali has developed into an important platform for African entrepreneurship through initiatives including timbuktoo.

2. The Studex Vision for Rwanda

Studex proposes an integrated ecosystem consisting of six major programmes.

Programme 1 - Studex AI & Business Infrastructure

Studex proposes working with Rwanda to develop and demonstrate an AI-native operating environment for government, businesses and startups.

Business Ghost: A secure institutional AI memory for an organisation. It preserves strategy, projects, meetings, decisions, documents, institutional knowledge, goals, tasks, customer information, project history and lessons learned.

Studex Agent OS: An operating environment for AI agents assisting organisations with research, customer service, sales, administration, business intelligence, project management, software development, knowledge management, training and reporting.

Secure Virtual Machines: Participating organisations receive isolated virtual workspaces for AI applications, local models, agents, development environments, data, training and government or enterprise pilots.

One objective of the mission is to demonstrate and formally hand over a pilot Studex virtual machine environment for evaluation by an appropriate Government of Rwanda technology institution. Any deployment would be subject to Rwanda's cybersecurity, privacy, procurement and data-governance requirements. Rwanda's current government data-sharing policy specifically emphasizes protected, governed data exchange and regulatory compliance.

3. Rwanda AI Data Centre Initiative

Studex would like to explore a longer-term programme for African AI compute infrastructure based in Rwanda. The vision could progress from:

Stage 1: Secure cloud and virtual-machine infrastructure. Stage 2: GPU and AI development nodes. Stage 3: University and startup compute infrastructure. Stage 4: Edge AI and sector-specific infrastructure. Stage 5: Modular AI data-centre capacity. Stage 6: A regional AI infrastructure hub supporting Rwanda and neighbouring African markets.

Studex's role could include demand aggregation, international technology partnerships, infrastructure partners, customer acquisition, startup workloads, enterprise workloads, AI platform integration, international fundraising, project financing, cloud partnerships and AI agent infrastructure.

The purpose would be to support African AI sovereignty through African-hosted capacity combined with appropriate

global technology partnerships.

4. Agentic Rise Rwanda

Studex proposes launching Agentic Rise Rwanda. The long-term target would be to identify and develop a network of approximately 100-1,000 AI-enabled Rwandan startups and specialist companies. The programme would focus on creating companies that can actually execute projects.

Participating companies could receive Business Ghost, AI agent, private workspace, training, international coaching, Global Markets opportunities, project opportunities, enterprise introductions, technical tools, startup support and fundraising readiness. The strongest companies could graduate into the Studex Super Agents network.

This model could complement rather than duplicate timbuktoo. Studex proposes adding an AI execution layer around this ecosystem.

Proposed progression pipeline:

```
TIMBUKTOO > Startup Discovery > Acceleration > Funding Readiness > STUDEX AGENTIC RISE > Business Ghost > AI Workforce > Execution Exchange > Real Projects > Revenue > SUPER AGENT
```

Architecture - the Rwanda execution map:

AFRICAN MARKETS

The Studex execution layer begins where acceleration ends: Agentic Rise equips funded startups with a Business Ghost (institutional memory) and an AI Workforce (agent team), connects them to the Execution Exchange for real project opportunities, and drives them to revenue - with the strongest graduates becoming Studex Super Agents operating across pan-African and Global Markets.

5. Studex Startup Foundation - Rwanda

Studex would also like to discuss establishment of a Studex Startup Foundation Rwanda programme. Its role would be to connect young founders, universities, developers, women entrepreneurs, gaming communities, international mentors, investors, corporates, government and technology partners.

The Foundation could coordinate: Startup competitions; AI bootcamps; Founder coaching; University programmes; International market access; Startup missions; Investor readiness; AI Company-in-a-Box deployments; Agentic Rise recruitment; Gaming and creator programmes.

6. Studex Arcade Rwanda

Gaming provides Studex with a high-engagement route into the youth technology ecosystem. Studex proposes an AI + Gaming + Entrepreneurship ecosystem, rather than a gaming competition alone. The model: PLAY - LEARN - BUILD - PITCH - EARN - START A COMPANY.

The Rwanda programme could include esports, gaming competitions, AI competitions, game development, coding, creator challenges, startup pitching, AI-assisted build challenges, AI training and talent discovery.

Successful participants receive a Studex Talent Passport documenting technical skills, projects, competition performance, reliability, leadership, teamwork and startup potential. The best candidates can progress into Midnight Founders Club and Agentic Rise.

7. Rwanda Gaming Challenge

Studex proposes a national gaming activation. Our ambition is to engage up to 1,000 Rwandan gamers and digital creators, subject to venue capacity, registrations and local partnerships.

The intention is not merely to identify Rwanda's best gamer. We want to identify Rwanda's next AI engineer, game developer, creator, founder and digital entrepreneur.

8. Gorilla AI Initiative

Studex would like to explore with Rwanda Development Board and relevant conservation institutions the possibility of a Gorilla AI programme. Potential areas for feasibility assessment: conservation analytics, wildlife monitoring, tourism technology, computer vision, visitor education, conservation data, research assistance, environmental monitoring and responsible citizen-science tools.

Rwanda already has experience combining technology and citizen participation in mountain-gorilla conservation through Visit Rwanda's Gorilla Gram initiative. Studex would approach this area as a partner to existing conservation systems rather than attempting to replace them. All wildlife technology should be designed with strict controls so that sensitive location or biological data cannot increase poaching or conservation risks.

9. Ankole AI & Agritech Initiative

Studex proposes exploring an Ankole AI programme around livestock and agricultural technology. Potential areas include animal identification, genetics, breeding records, livestock health, veterinary AI, farm management, supply-chain traceability, export documentation, ESG and provenance information and marketplace development.

The objective would be to investigate how Rwanda's agricultural heritage can be combined with modern AI, traceability and international premium-market development.

10. Women in Coffee - Rwanda to Global Markets

Studex proposes launching a women-led Rwanda coffee export and international market-access initiative. Coffee is already a major economic sector in Rwanda, supporting approximately 400,000 smallholder farming families. Rwanda's coffee exports reached nearly US$150 million in 2025, with export revenue increasing strongly year-on-year.

The programme focuses on women farmers, women-owned coffee businesses, female exporters, young female entrepreneurs, premium coffee branding, international buyers, Russia and other international markets, technology-enabled traceability, AI marketing and export intelligence, and direct market relationships.

Studex would like to work with NAEB and existing licensed exporters rather than bypass Rwanda's export framework. Rwanda requires coffee exporters to obtain the appropriate NAEB export licence as well as origin, quality and phytosanitary documentation.

11. Women Entrepreneurship Forum

Studex proposes hosting: "Women Building the Next African Economy" - Top 50 Rwandan Women Entrepreneurs. Themes: Women in Coffee & Global Trade; Women, Art & Digital Assets; Women in AI & Infrastructure; Women Founders in Rwanda; Studex Global Markets - how women-led companies access international buyers, technologies, partners and investors. The objective would be to establish an ongoing Rwanda Women Global Markets Network.

12. Proposed Mission Programme

Monday: Arrival, government and partner meetings; Studex Rwanda AI Hackathon - "Building Rwanda's AI Companies of Tomorrow"; AI training, agent demonstrations, Business Ghost demonstration, startup challenges, Agentic Rise recruitment; Podcast: Rwanda, AI and Africa's Next Technology Economy.

Tuesday: Coffee farm/ecosystem visit (farmers, women producers, cooperatives, washing stations, exporters, NAEB stakeholders); Women Entrepreneurship Forum; Podcast: Women Building Africa's Global Businesses.

Wednesday: AI Build Day - practical hackathon across startup building, AI agents, software, games, agriculture, coffee/export tools, conservation, tourism, government technology. Training Session: Building an AI Company in a Box.

Thursday: Conservation & Gorilla Day - visit to Rwanda's gorilla conservation/tourism ecosystem, subject to permits and availability. Observation and discovery day.

Friday: Studex Arcade Rwanda - Gaming + AI + Creator Competition, up to 1,000 participants; Training Session: AI, Gaming and Digital Entrepreneurship; Government Technology Demonstration - pilot Business Ghost + Secure VM, formally making a pilot VM environment available for government technical evaluation, subject to agreement on security, hosting, access and data governance.

Saturday: Strategic Closing Session - review with partners and government representatives, present outcomes and agree next steps.

13. What Studex Is Asking From the Government of Rwanda

Meetings and introductions with appropriate stakeholders connected to: ICT and AI (national AI strategy, AI Agency engagement, AI skills, VM pilot, data-centre discussions); Rwanda Development Board (investment, startup ecosystem, global business development, conservation/tourism innovation, international partnerships); Rwanda Information Society Authority / digital institutions (technology, government digital systems, infrastructure, AI pilot evaluation); NAEB / Agriculture institutions (coffee farms, women in coffee, export programmes, international market access); timbuktoo / UNDP ecosystem (startup development, Agentic Rise, AI tools for startups, joint challenges); Universities (AI talent, hackathons, student entrepreneurship, gaming, research); Tourism / Conservation stakeholders (Gorilla AI feasibility, conservation technology, responsible tourism).

14. Proposed Rwanda Legacy

1. Agentic Rise Rwanda - a permanent AI startup execution network.

2. Studex Arcade Rwanda - a gaming and digital-talent community.

3. Rwanda Women Global Markets - a programme connecting women-led businesses to international markets.

4. Women in Coffee Export Programme - a structured route from producer to premium international buyer.

5. Rwanda AI Infrastructure Roadmap - a feasibility programme for VMs, GPU infrastructure and modular AI data centres.

6. Government AI Pilot - a secure VM and Business Ghost evaluation.

7. Gorilla AI Feasibility Programme - responsible AI for conservation and tourism.

8. Ankole AI & Agritech Programme - livestock, traceability, genetics, veterinary and premium agricultural-market development.

9. Studex Startup Foundation Rwanda - a founder-development and international opportunity platform.

10. Studex x timbuktoo Collaboration - an execution layer complementing Rwanda's existing pan-African startup infrastructure.

15. Our Proposed Message to Rwanda

Rwanda has already created many of the ingredients required for Africa's next technology economy: policy, talent, innovation institutions, entrepreneurship, international credibility, startup infrastructure. Studex would like to help connect those ingredients to an additional execution layer: AI agents + infrastructure + startups + enterprise opportunities + international markets + trade + talent.

We respectfully request the opportunity to meet the Government of Rwanda and relevant ecosystem institutions to present this proposal, demonstrate our technology and explore a structured Rwanda-Studex implementation programme.

Our goal is simple: Build in Rwanda. Train in Rwanda. Export from Rwanda. Scale from Rwanda into Africa and the world.
